

My Ulcerative Colitis Activity Index:

Patient-Reported Information to Share With Your Healthcare Professional

The proposed Ulcerative Colitis Activity Index—published in the *2019 American College of Gastroenterology (ACG) Clinical Guideline: Ulcerative Colitis in Adults*—can be used by people with ulcerative colitis (UC) as a tool to track some of their symptoms and share that information with their healthcare professional team.^{1,2}

The proposed ACG index focuses on three symptoms that a patient with UC may experience: stool frequency, blood in stools, and urgency. There are other UC symptoms and physician-ordered tests that are not reflected in the proposed guidelines. All patients are different. People's symptoms and disease severity level may vary. Using the proposed ACG index, you can collect information on some of your symptoms—information that can serve as the basis for discussion with your healthcare team about your UC disease management plan.

The important patient-reported information you can provide to help your healthcare professional team track your UC disease activity includes:

Stool frequency

Blood in stools

Urgency
